

Analog Beamforming Analysis Using MATLAB

Aim

To analyze the performance of analog beamforming by studying beamforming gain, beam width, and main lobe direction using MATLAB.

Objectives

1. To analyze the beamforming gain achieved by varying the number of antenna elements in an analog beamforming system using MATLAB.
2. To compare the beam width of an antenna array for different beamforming configurations using MATLAB.
3. To analyze the main lobe direction by steering the antenna array beam to different angles using MATLAB.

Software Required

- MATLAB

Theory

Analog beamforming is a beam steering technique in which a single RF chain drives multiple antenna elements through adjustable phase shifters. By controlling the phase of the transmitted or received signals, the antenna array forms a directional beam toward the intended user, thereby improving signal strength, coverage, and spectral efficiency. Analog beamforming is widely employed in millimeter-wave (mmWave) communication systems due to its reduced hardware complexity and lower power consumption.

Objective – 1

Analyze Beamforming Gain (dB)

Generate beamforming gain values for different antenna array sizes using MATLAB.

Compare

how increasing the number of antenna elements improves the beamforming gain and enhances signal strength.

MATLAB Code:

```
clc;
clear;
close all;
antennas = [2 4 8 16 32]; % Number of Antenna Elements
gain = 10*log10(antennas); % Beamforming Gain (dB)
figure
bar(antennas, gain)
grid on

xlabel('Number of Antenna Elements')
ylabel('Beamforming Gain (dB)')
title('Beamforming Gain for Different Antenna Array Sizes')
Expected Output
```

```

clc;
clear;
close all;
antennas = [2 4 8 16 32]; % Number of Antenna Elements
gain = 10*log10(antennas); % Beamforming Gain (dB)
figure
bar(antennas, gain,"cyan")
grid on

xlabel('Number of Antenna Elements')
ylabel('Beamforming Gain (dB)')
title('192512146 Beamforming Gain for Different Antenna Array Sizes')

```

- Bar graph showing beamforming gain for different antenna array sizes.

Objective – 2

Compare Beam Width (Degrees)

Analyze the beam width corresponding to different antenna array sizes using MATLAB. Observe

how increasing the number of antenna elements results in a narrower beam, thereby improving spatial resolution.

MATLAB Code:

```

clc;
clear;
close all;
antennas = [2 4 8 16 32]; % Number of Antenna Elements
beamwidth = [90 45 22.5 11.25 5.625]; % Beam Width (degrees)
figure

```

```
plot(antennas, beamwidth,'o-','LineWidth',2)
grid on
```

```
xlabel('Number of Antenna Elements')
ylabel('Beam Width (Degrees)')
title('Beam Width for Different Antenna Array Sizes')
```

Expected Output

```
clc;
clear;
close all;
antennas = [2 4 8 16 32]; % Number of Antenna Elements
beamwidth = [90 45 22.5 11.25 5.625]; % Beam Width (degrees)
figure
plot(antennas, beamwidth,'o-','LineWidth',2,'Color',"magenta")
grid on

xlabel('Number of Antenna Elements')
ylabel('Beam Width (Degrees)')
title('192512146 Beam Width for Different Antenna Array Sizes')
```

- Line graph showing beam width versus antenna array size.

Objective – 3

Analyze Main Lobe Direction (Degrees)

Simulate beam steering by varying the steering angle of the antenna array using

MATLAB.

Observe the change in the main lobe direction and understand how analog beamforming directs energy toward the intended user.

MATLAB Code:

```
clc;
clear;
close all;
theta = [-60 -30 0 30 60]; % Main Lobe Direction (degrees)
```

```
gain = [1 1 1 1 1]; % Constant normalized gain
figure
polarplot(deg2rad(theta), gain, 'o', 'LineWidth', 2)
title('Main Lobe Direction in Analog Beamforming')
```

Expected Output

```
clc;
clear;
close all;
theta = [-60 -30 0 30 60]; % Main Lobe Direction (degrees)
gain = [1 1 1 1 1]; % Constant normalized gain
figure
polarplot(deg2rad(theta), gain, 'o', 'LineWidth', 2, 'Color', 'magenta')
title('192512146 Main Lobe Direction in Analog Beamforming')
```

- Polar plot or beam pattern showing the main lobe steered to different angles.

Result

The MATLAB analysis successfully demonstrated the characteristics of analog beamforming. The results showed that increasing the number of antenna elements improves beamforming gain and reduces beam width, while phase adjustment enables the main lobe to be steered toward different directions.
